

The recent years were crucial for tigers, in 2021 tiger population has decreased by about 1000 tigers every year. Even though people from different countries are respecting government choices, tigers still appear to be dying out. According to the International Union For Conversation Of Nature, all types of tigers are listed on the red list, which is the critically endangered animal. Scientists think that the reason is because of not so eco friendly choices of humans, like automotive production is also a threat to tigers because when they make new cars, they construct new factories to make the cars. The making of factories destroy the forests and land which tiger live in. The land which is being used for factories and other type of industrial buildings, which include the cutting down of trees will also destroy the tiger habitats and not only tiger habitats, but other species of animals which live in the tiger habitats.

## Animal tiger 2

Every year cars will be built in factories more and more, which is not good for the environment, and if there is too much smoke in the sky, then tigers cannot survive as most animals cannot live in smoke. The more smoke is in the sky, the more pollution will increase and then the whole Earth will warm up and that is called Global Warming. House production will of course increase so that makes the same affect to tigers as factories, but we cannot do anything about it so we need to do something else to help the tigers survive in the wild and in captivity. This persuasive book is to persuade you to help the tigers. Scientists already have started to help tigers, but that is not enough. If tigers ever went extinct then it would affect human life and will create ecosystem disabilities.

## Animal tiger 3

Some problems if the tiger ever went extinct is that the prey which tiger eats will also not be able to survive because the animals population will grow and grow. After the population is big, then all the animals will drink from a river or lake near that area. Since there will be too many animals, the water will eventually finish. Once the water finishes then the animals will have no water, then it will start dying out just like tigers. Without tigers, the whole ecosystem will collapse since tigers are at the top of the food chain. Tigers normally prey on herbivores which eat plants. If there are too many herbivores then tree and plant population will be limited, which will cause a problem because plants provide oxygen for us to breathe. We need to keep tigers away from poachers which will kill tigers and involve themselves in illegal activities.

## Animal tiger 4

Healthy tiger population live in large forests which acts as carbon stores. The more tigers we save, the healthier reserves we get. If tigers are extinct then humans will cut down forests for making factories and houses and since there won't be any trees then humans will give out carbon dioxide and that carbon dioxide gets trapped in the air which will cause global warming. Another thing which would happen is that when tiger will become extinct, poachers will go to another species of animal to hunt just like they hunted tigers. Tigers also drive economies. Wherever the tiger lives, tourist go to that place. When tourists go, money can be made by communities all over the world. We also need to protect large swaths of forest all across Asia where they originally live. By protecting these places where they live can also help tigers. Not only by saving those forests which tiger prefer to live in, we can also help other species of animals which live there.

## Animal tigers 5

As forests shrink and prey becomes scarce, tigers are forced to hunt in human areas which many local communities think that tigers will affect their livelihood and because of that reason tigers are killed or captured. After humans kill the tiger they make rugs, traditional medicines and a lot more with only tiger skin or fur, which is sold illegally in the Black Market. There are many ways to help tigers from becoming extinct. Do not buy fur rugs or any type of traditional medicine which has tiger skin or fur in the ingredients, keep tigers in captivity away from poachers, don't cut down trees or any type of tiger habitat, build tiger habitat, example : plant more seeds in forests where tiger habitat is, give money to tiger charity funds or government funds. Some organizations that's have their own tiger charity funds are : Panthers, Save The Tigers Fund, World Wild Life Fund etc.

## Animal tiger 6

Let me tell you some amazing facts about tigers. Tigers are easily recognized by its coat of orange and black. The tiger is the biggest cat in the cat family. Some people think that lions are the biggest wild cats, but tigers are the biggest wild cats. A tiger's tail is normally 3 feet long. The whole body weighs about 450-500 pounds. The tiger can stand up and when it does stand it stands 3 feet tall. Its claws and teeth are about 4-5 inches long. The most common tiger in the world is the Royal Bengal tiger. The Bengal Tiger's scientific name is *Panthera tigris tigris*. All tigers are carnivores and its average lifespan is about 10-20 years in the wild. A female tiger gives birth to a litter of three or four cubs at a time. This powerful predator generally hunts alone, able to kill prey like deer, antelope, water buffalo, boars and wild goat. The way the tiger hunts is by a sudden sprint on its prey, it waits in a place where it almost camouflages, when its prey comes then the tiger makes a sudden sprint and catches the neck of its prey.

## Animal tiger 7

While it has the neck of the prey in the jaw of the tiger it carries it back home so that it can rip off the flesh of the tiger's prey and eat it peacefully. Tigers have been known to eat at least 60 pounds of meat in one night. A liger is a hybrid of a male lion and a female tiger. A Tigon is a hybrid of a female lion and a male tiger. Normal tigers cannot survive in cold weathers, but Siberian tiger or also called Amur tiger can survive in the cold. Sometimes some tigers have a group which is called a streak or an "Ambush". Different species of tigers live in different parts of the world. Siberian Tigers live in Russia and Ukraine, Bengal Tigers live in India, Bangladesh and Nepal, Sumatran tigers live in Indonesia, Malaysian tigers live in Malaysia, Indochinese tigers live in part of North India and South China.

## Animal tiger 8

Even though 4 subspecies of tigers are extinct, 6 more do still exist. These six include Siberian tiger, Bengal tiger, Sumatran Tiger, South China tiger, Indochinese Tiger and Malayan tiger. All of these tigers are endangered, however the Sumatran tiger and the South china tiger are critically endangered on the IUCN list. The 4 subspecies of tiger which are extinct are the Bali tiger, Caspian Tiger, Javan tiger and the Tasmanian tiger. The Sumatran tiger is the smallest tiger in the world. There are 13000 tigers left in the whole world, but only 5000 tigers live in the wild and 8000 tigers live in captivity.

## Animal tiger 9

These are all the important facts about tigers. Tigers are in danger and we humans don't do anything about it, but now we have the chance to make tigers live again peacefully without any worry of the extinction. About a century back there were 100000 tigers alive now in 2022 there are only 13000 tigers left in the whole world, if we don't do this tigers can become extinct as soon as 2025. I encourage you not to kill tigers anymore and help them so that the future of tiger, human and even many other animals are secured. As I have told tigers play a very important role in the ecosystem and if we kill them then humans and other animals will all die. I hope I have persuaded you to help tigers, but I think that if we help tigers there will be a good future for animals and humans too.
